Data Synopsis	1
Analysis Question 1	1
Analysis Question 2	2

Introduction

Ask a home buyer to describe their dream house, and they probably won't begin with the height of the basement ceiling or the proximity to an east-west railroad. However, it is essential to review the data because it proves that there are many other influences in price negotiations than the number of bedrooms or a white-picket fence.

Data Synopsis

The Ames House dataset was compiled by Dean De Cock and contains 79 explanatory variables describing almost every aspect of residual home in Ames Iowa from 2006 to 2010. The data set contains 2930 observations involved in assessing home values.

Analysis Question 1

\subsection{Restatement of Problem}

In order to build and fit a model, an analysis must be performed to identify features of the dataset that are statistically significant in their relation to, and prediction of, the sales price.

Ames'SalesPrice = $B_0 + B_1\text{BrkSide} + B_2\text{Edwards} + B_3\text{NAmes} + B_4(\text{LogLivingAreaBrkSide}) + B_5(\text{LogLivingArea} \times \text{Edwards})$

$\hat{\mu}\{Force | Species, Height\} = \beta_0 + \beta_1 Height + \beta_2 Cancer + \beta_3 Hemi + \beta_4 (Height \times Cancer) + \beta_5 (Height \times Hemi)$

$$\hat{\text{AmesSalesPrice}} = 8.49 + (-2.58\text{BrkSide}) + (-0.49\text{Edwards}) + (0.0 * \text{NAmes}) + (B30.0) + B4(0.47\text{BrkSide}) + B5(0.47*\text{Edwards})$$

Plot the data. Develop a tentative model(s). Using the question(s) of interest (QOI). Accounting for confounders. Accounting for relationships (X^2 , X^3 , etc.). Fit the model(s). Evaluate residual plots. Constant SD. Normality and zero mean. Identify any influential observations.

Analysis Question 2
